

Conformance Checking

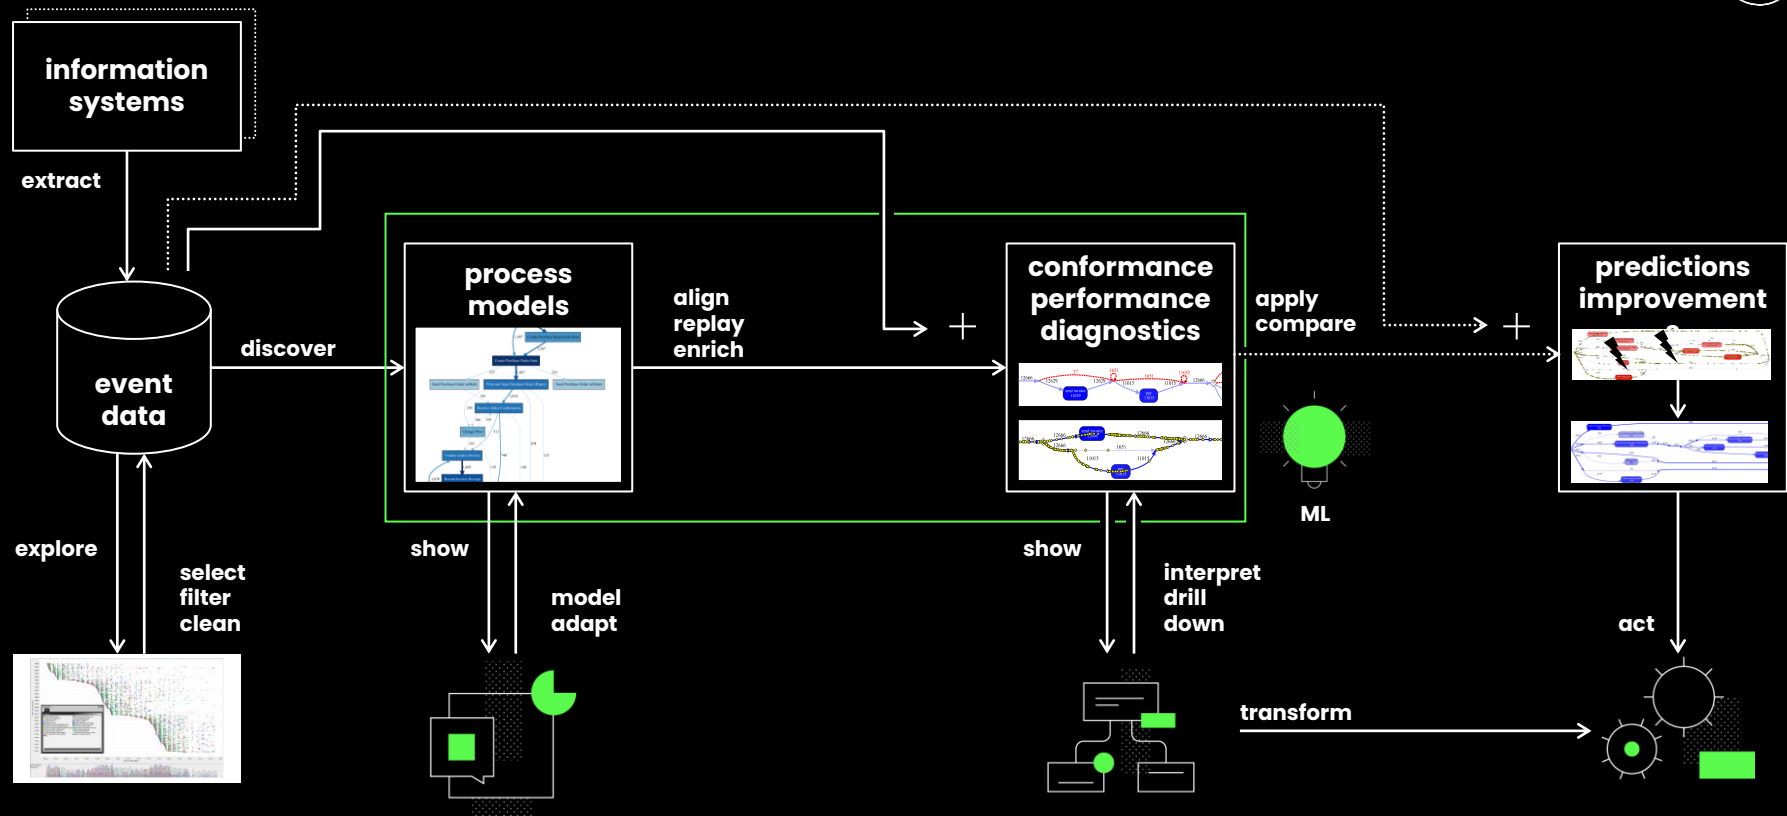

Checking compliance and analyzing deviations

Process Mining:
From Theory to Execution

prof.dr.ir. Wil van der Aalst

www.vdaalst.com | @wvdaalst | www.pads.rwth-aachen.de

Input: Event data and process model

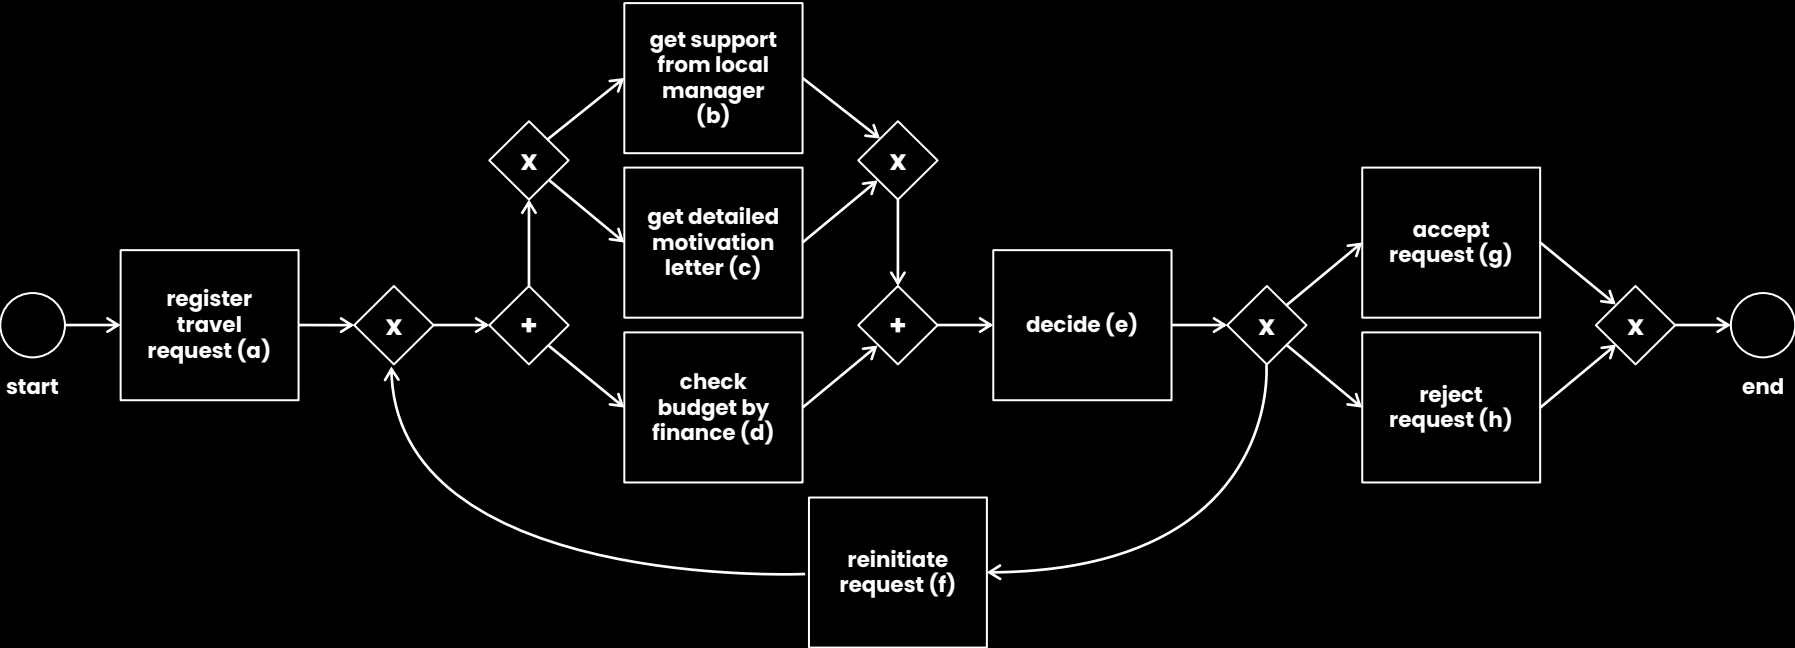

conforming

a b d e g

deviating

a b c e h

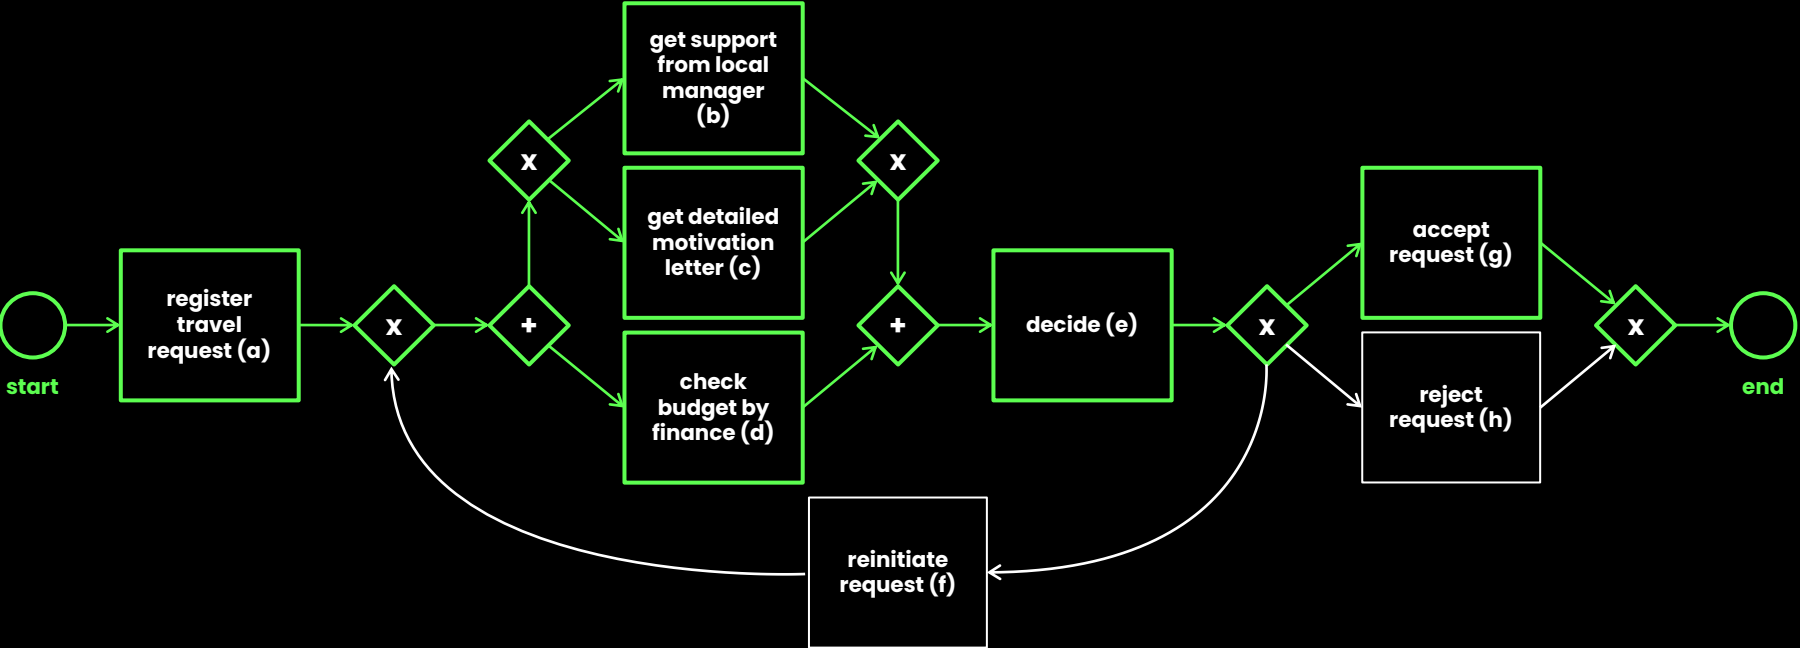

Conforming case

conforming

- a
- b
- d
- e
- g

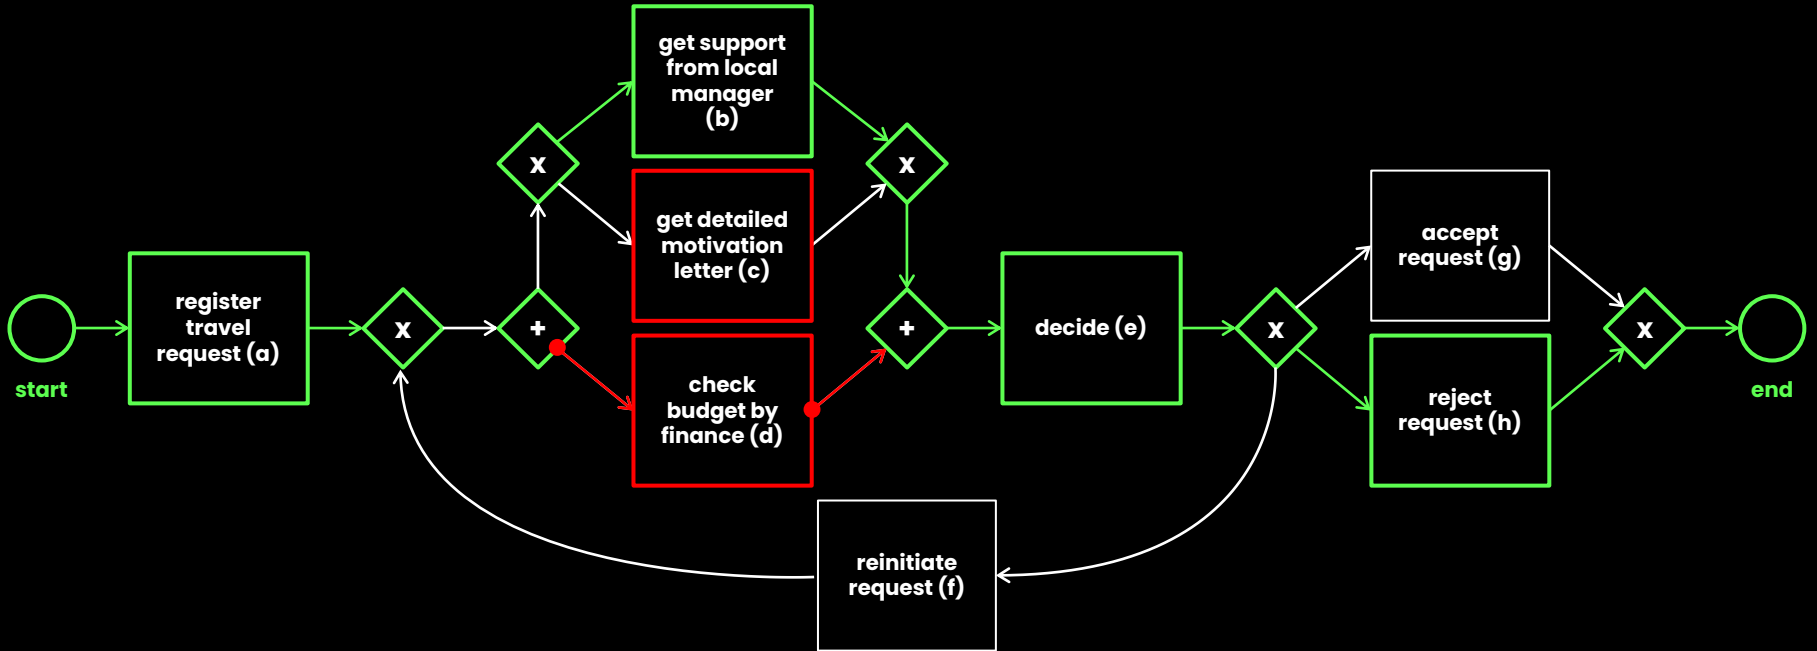

Deviating case

C

deviating

a b ~~c~~ d h

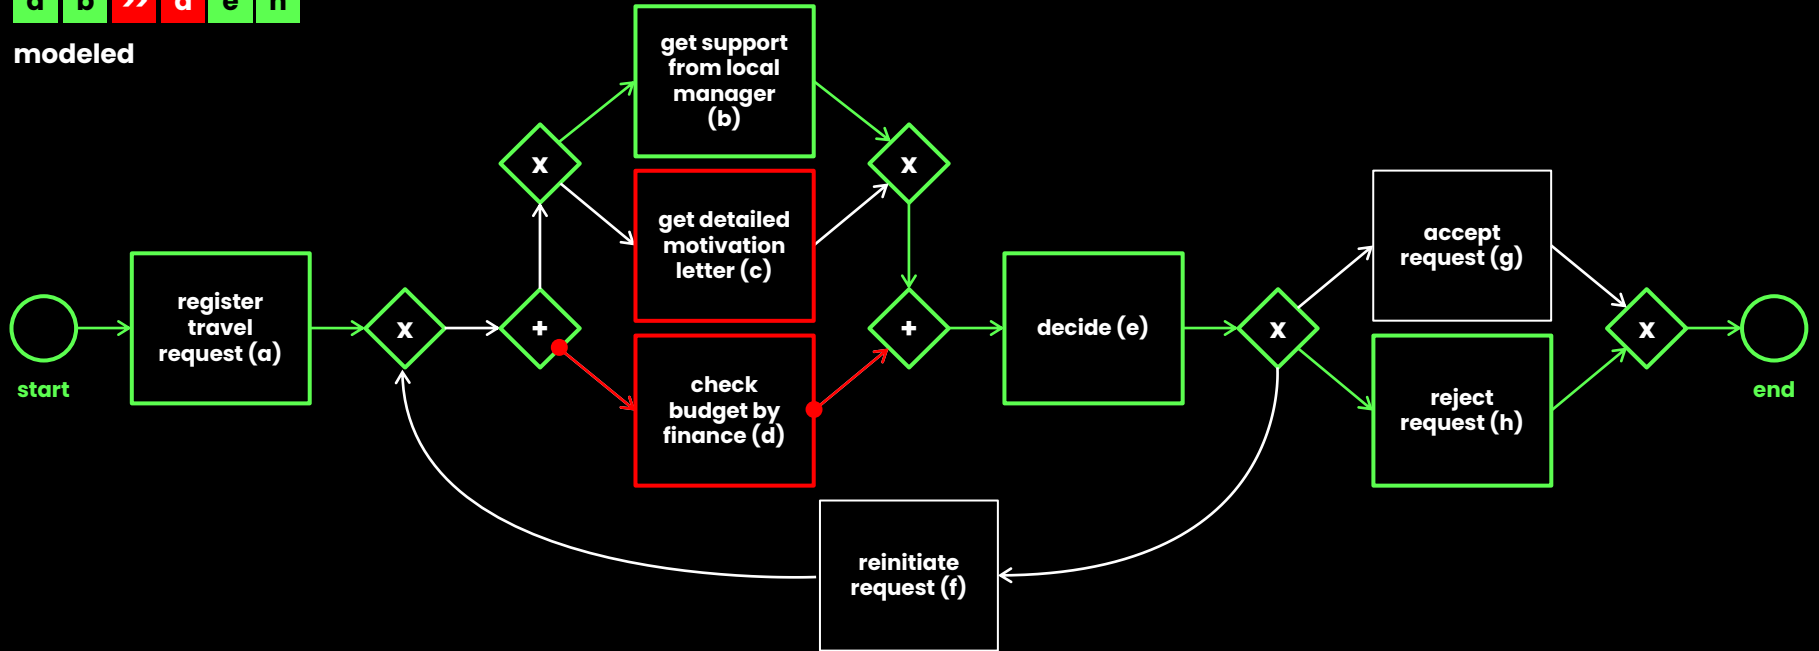

Alignment: Relating observed and modeled behavior

observed

modeled

Alignments do not need to be unique

1

2

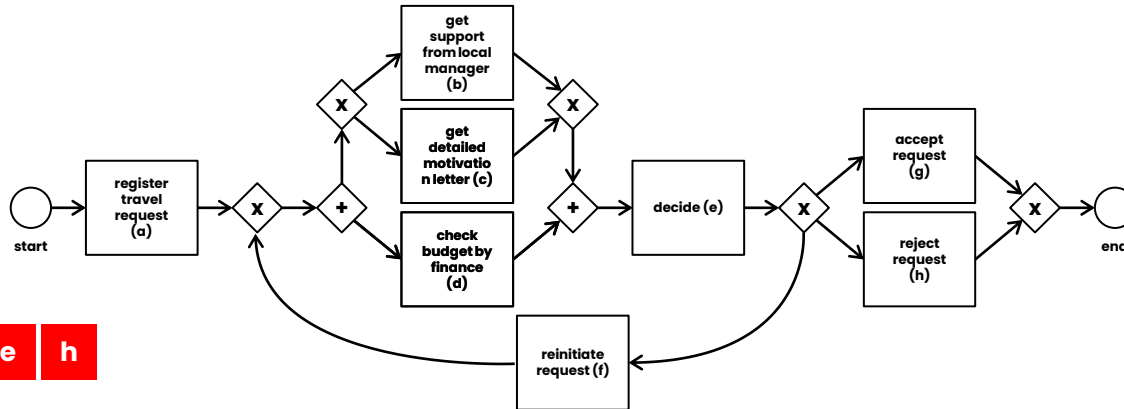

3

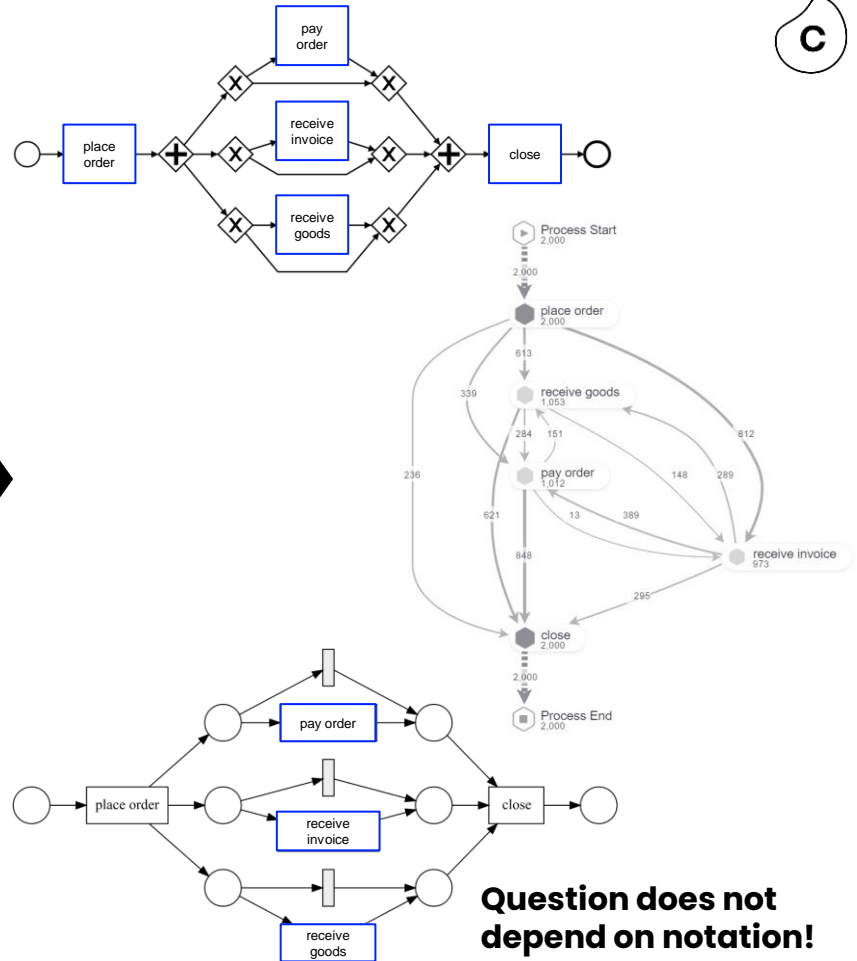

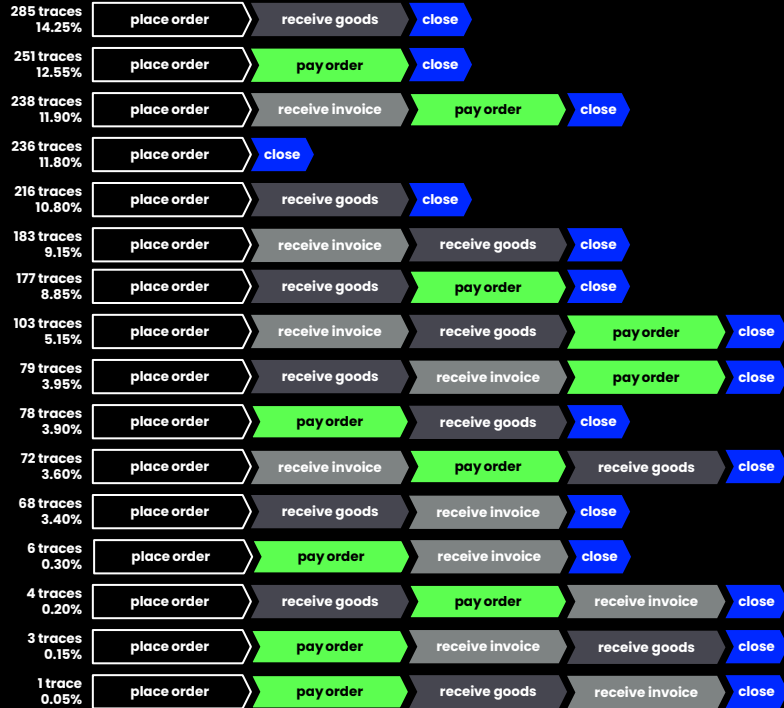

4

+ 2 more

Find a "nearest path" in the model

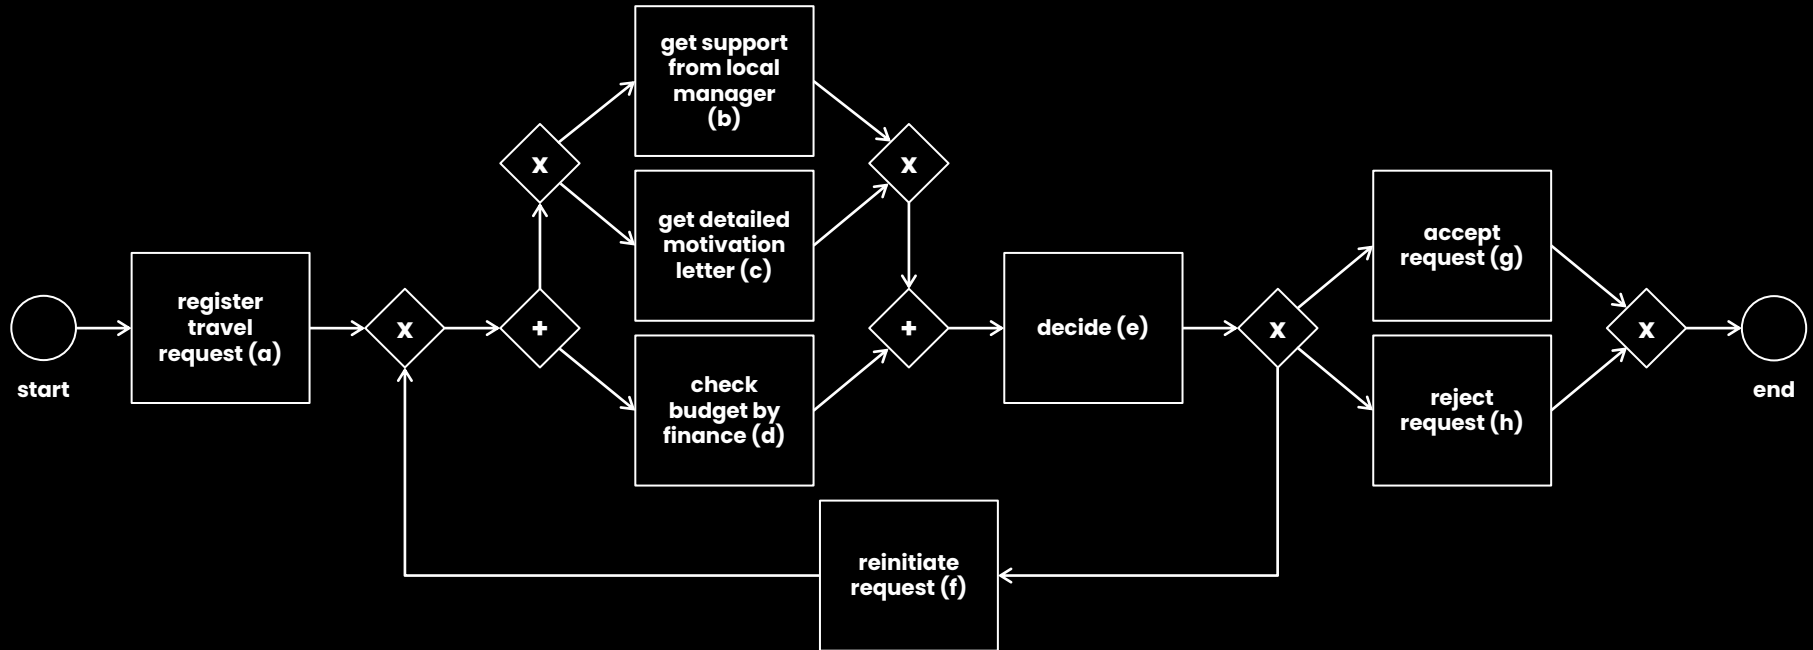

C

Provide an optimal alignment

observed

a b d d e f f b e g

Provide an optimal alignment

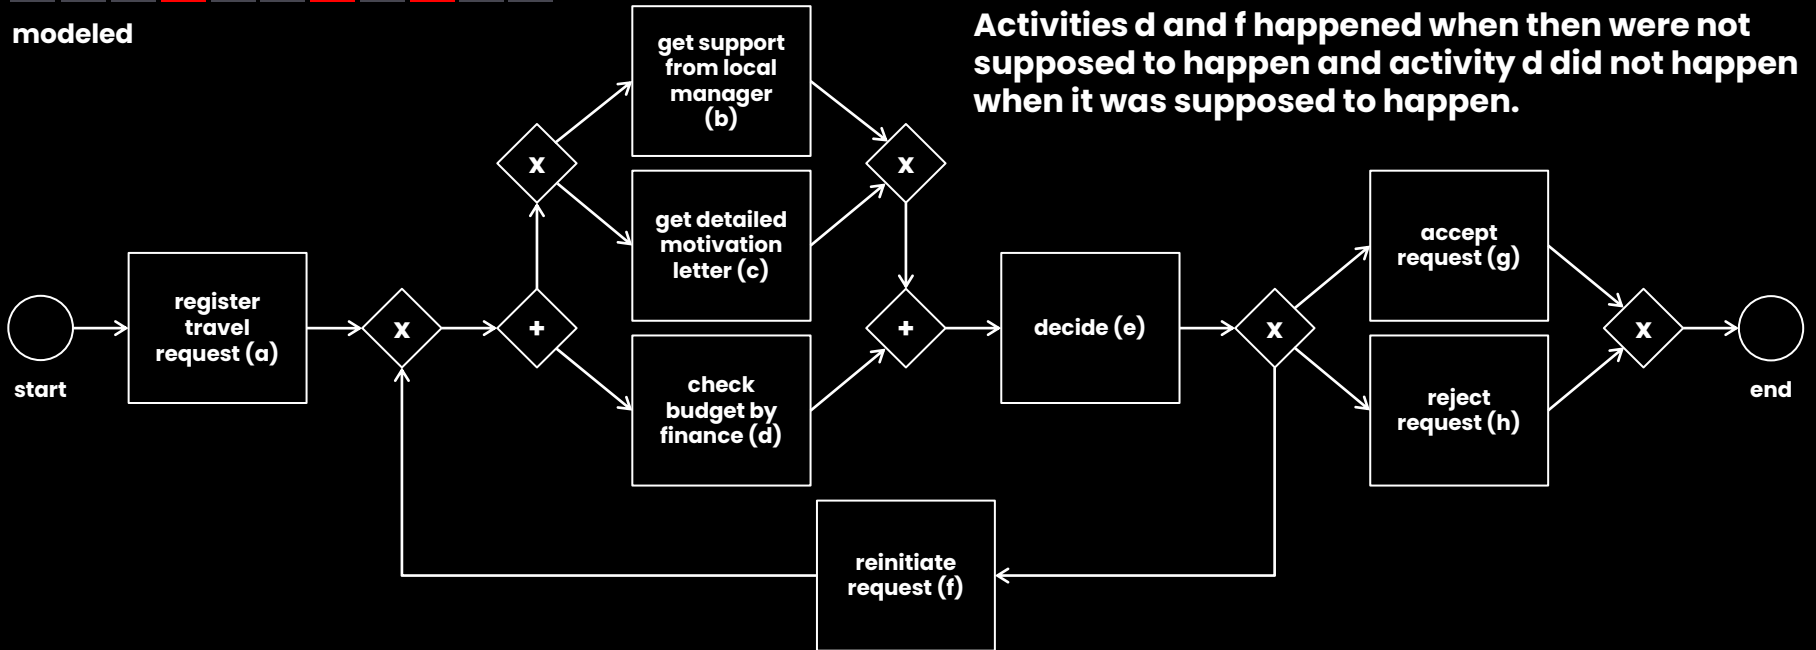

observed

a b d d e f f b >> e g

a b d >> e f >> b d e g

modeled

Activities d and f happened when they were not supposed to happen and activity d did not happen when it was supposed to happen.

Conformance checking questions (1/2)

- A process model describes a **set of possible traces**
- An event log contains a **multiset of observed traces**

Basic questions:

- Which traces in the log are “fitting” the model?
- What is the percentage of “fitting” traces?
- Which modeled activities are often skipped in reality?
- Which observed activities are often impossible according to the process model?

Conformance checking questions (2/2)

Advanced questions

- Which (shorter) traces, possible according to the model, never happen?
- What is the precision of the model (fraction of modeled behavior actually observed)?
- What do specific deviations have in common?

There are many ways to quantify conformance:

- Trace or event level
- Fitness (recall)/precision
- Adding time, resources, etc.

Alternative 1: Comparing footprints

Footprint	a	b	c	d	e
a	#	→	→	#	→
b	←	#		→	#
c	←		#	→	#
d	#	←	←	#	←
e	←	#	#	→	#

Footprint	a	b	c	d	e
a	#	→	→	#	#
b	←	#		→	#
c	←		#	→	→
d	#	←	←	#	←
e	#	#	←	→	#

Alternative 1: Comparing footprints

$$\frac{25 - 4}{25} = 0.84$$

Footprint	a	b	c	d	e
a	#	→	→	#	→
b	←	#		→	#
c	←		#	→	#
d	#	←	←	#	←
e	←	#	#	→	#

Footprint	a	b	c	d	e
a	#	→	→	#	#
b	←	#		→	#
c	←		#	→	→
d	#	←	←	#	←
e	#	#	←	→	#

Alternative 2: Token based replay

**produced
tokens**

**consumed
tokens**

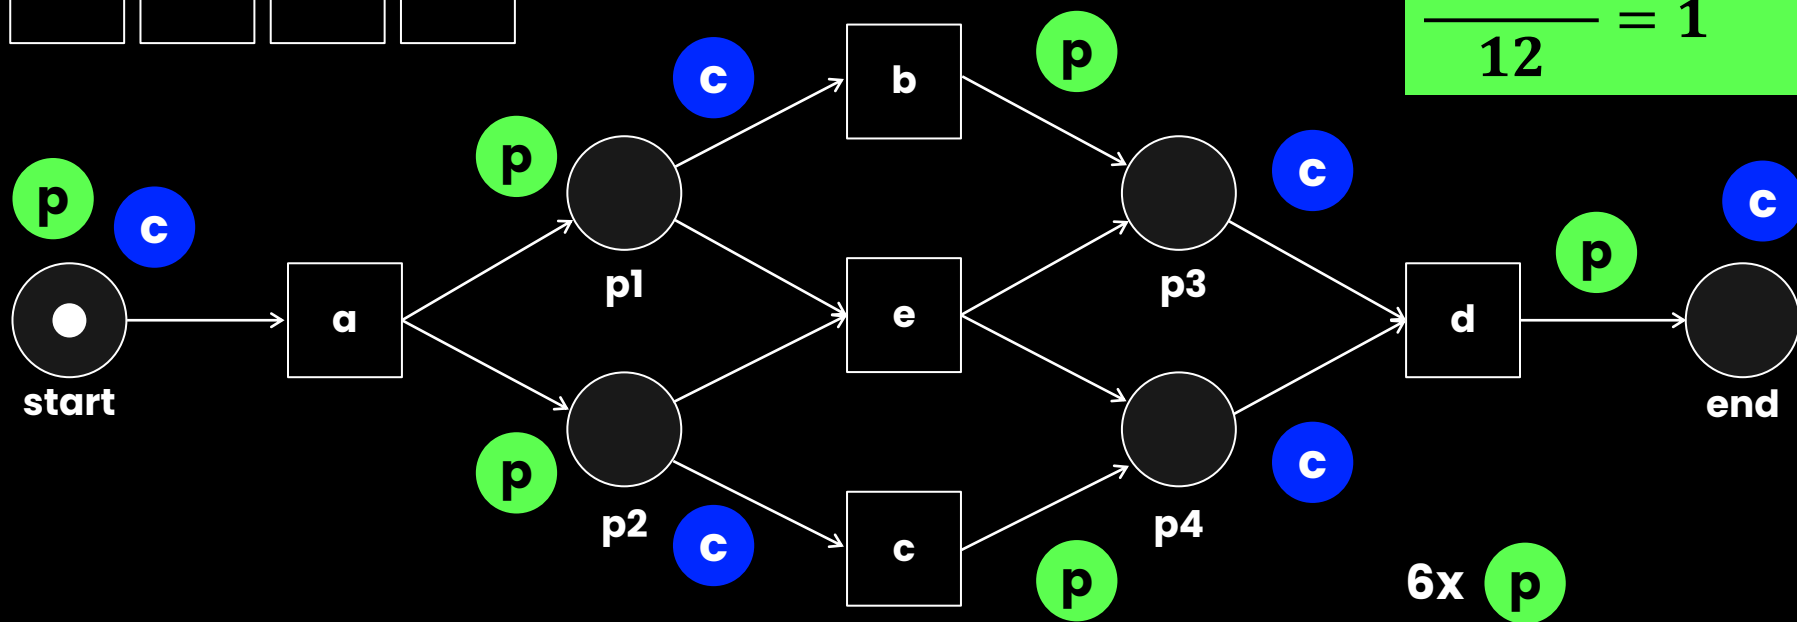

missing tokens
(something could
not happen)

**remaining
tokens**
(something should
have happened)

Alternative 2: Token based replay

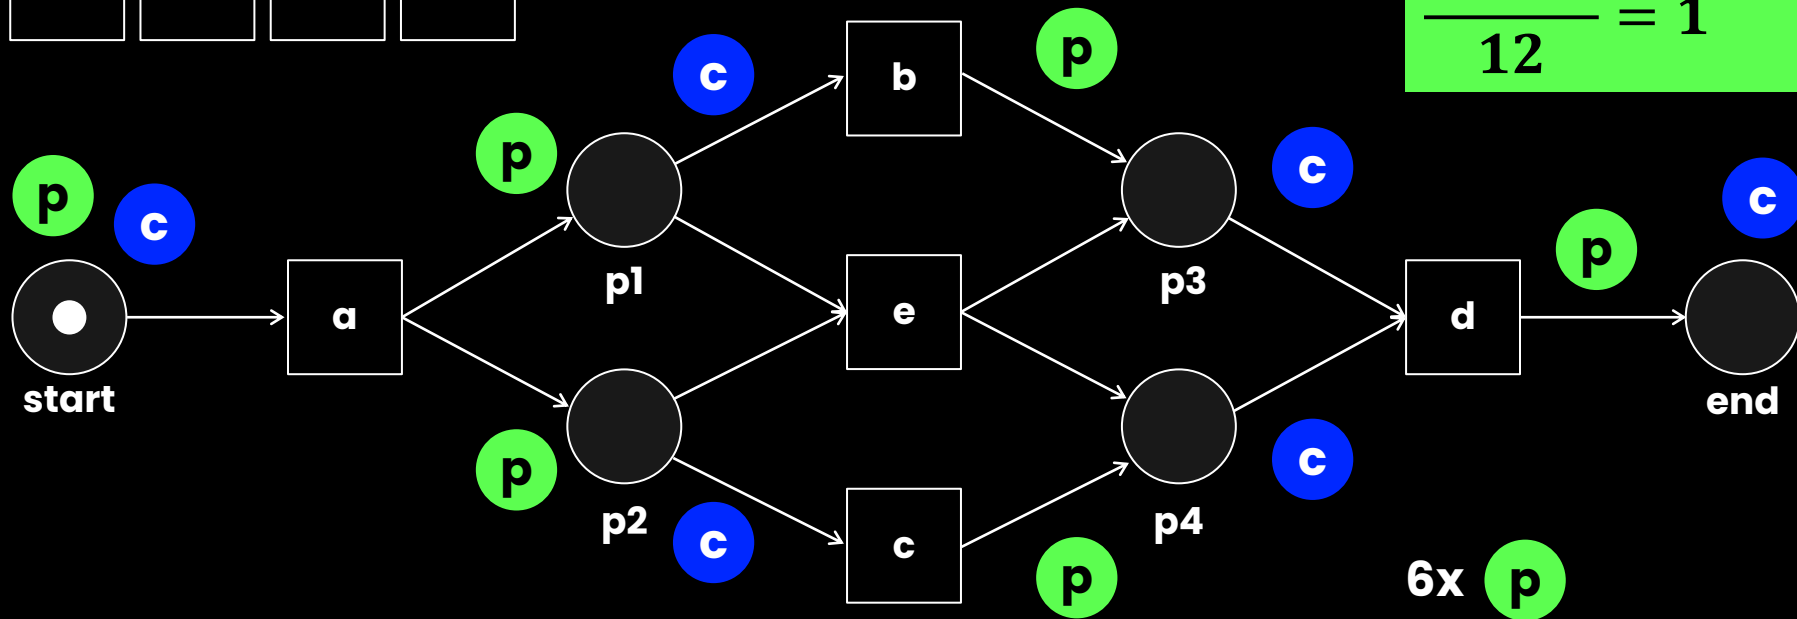

$$\frac{12 - 0}{12} = 1$$

6x

6x

Alternative 2: Token based replay

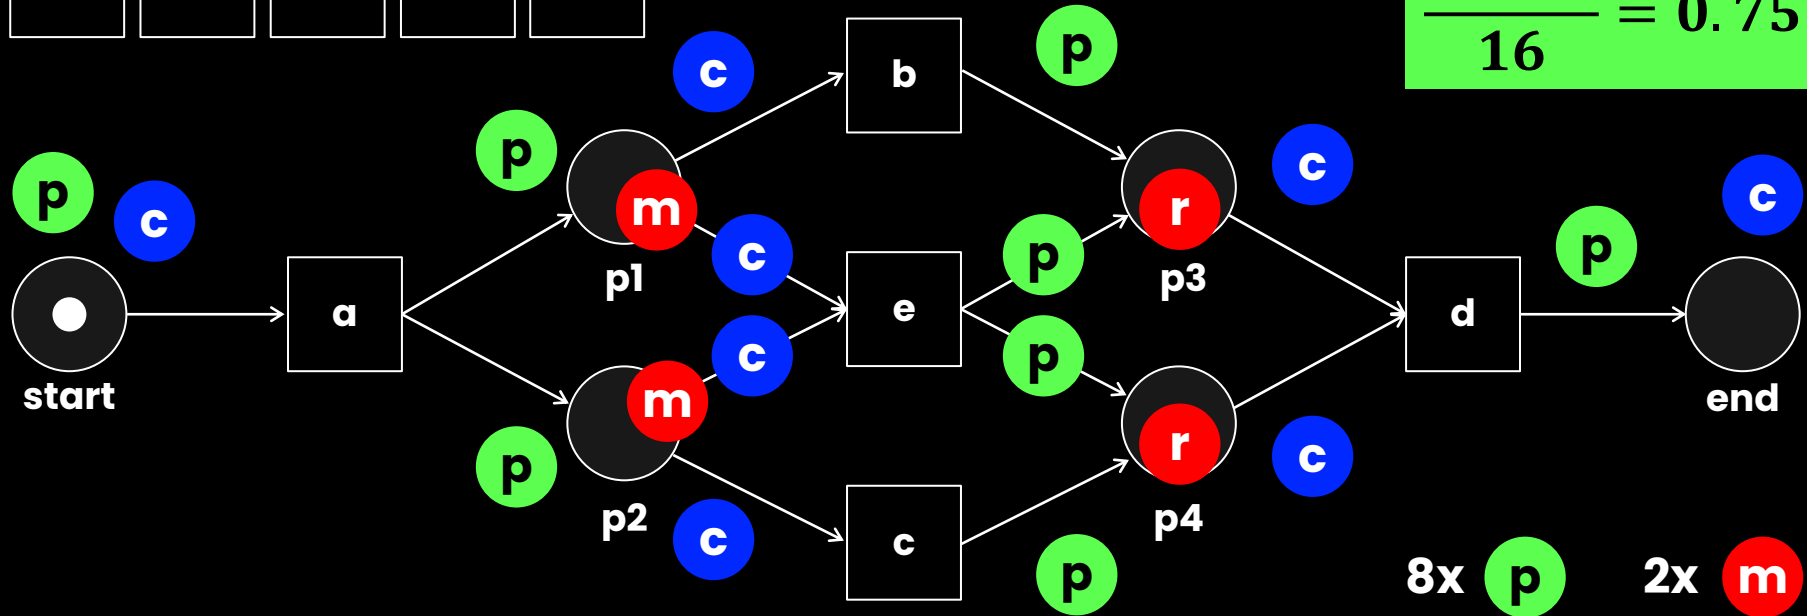

$$\frac{12 - 0}{12} = 1$$

6x

6x

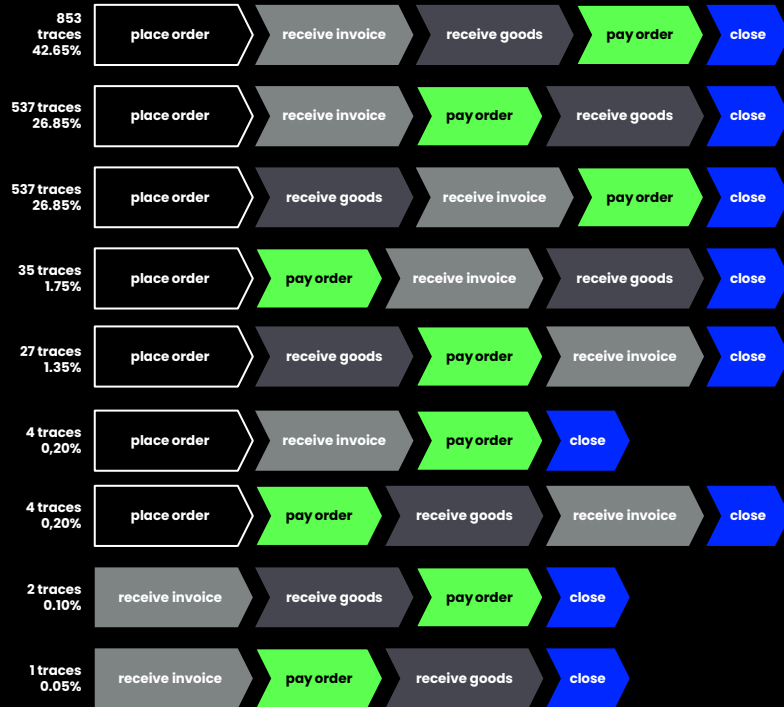

Alternative 2: Token based replay

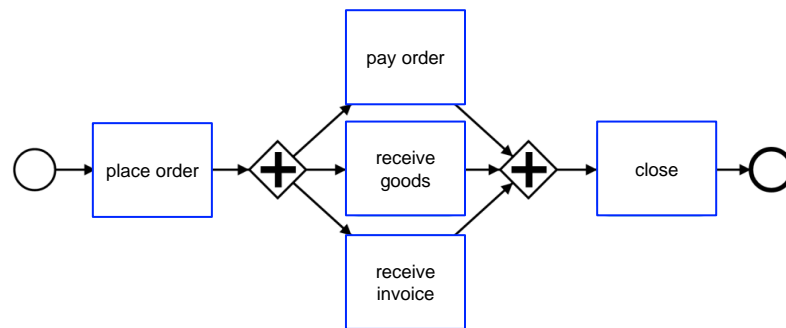

$$\frac{16 - 4}{16} = 0.75$$

8x 2x
8x 2x

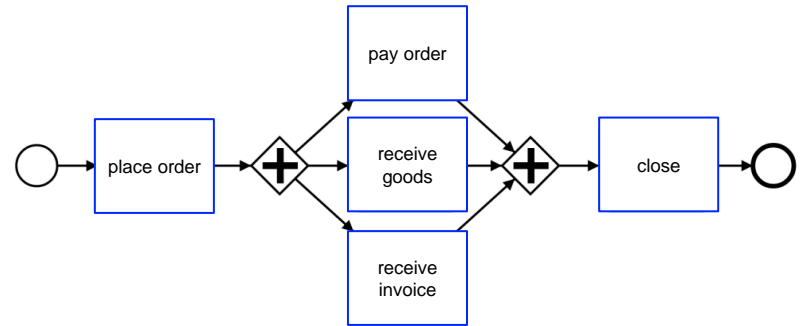

Example: 2000 cases

Find the deviating traces!

Example: 1993 cases are conforming

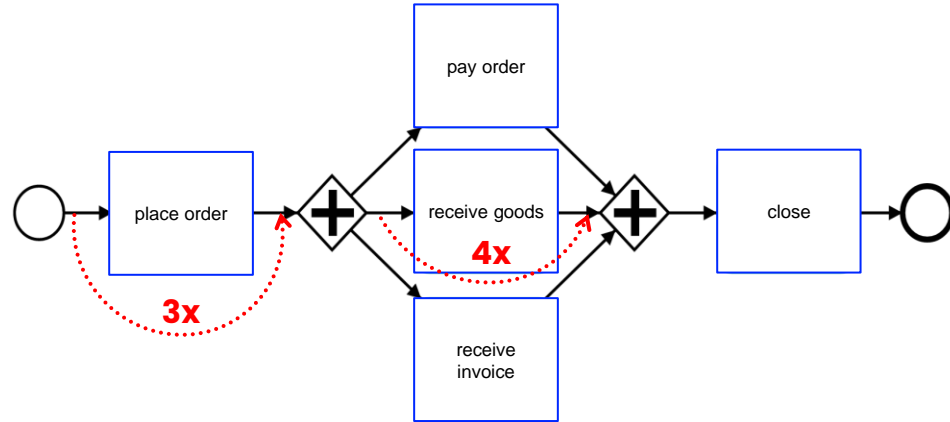

C

Example: 7 cases are not conforming

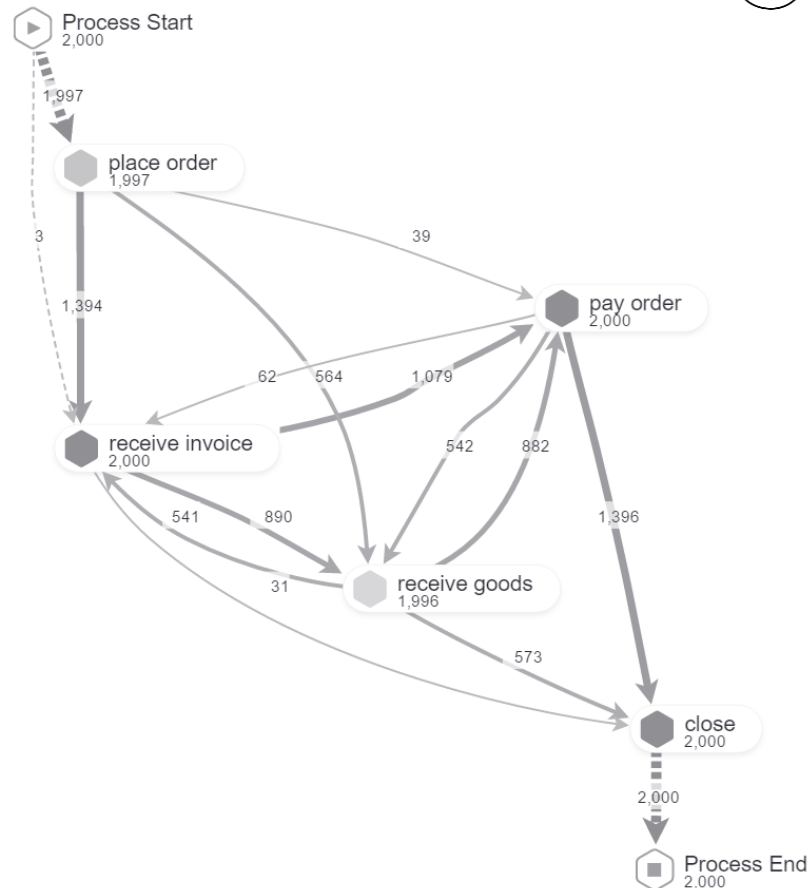

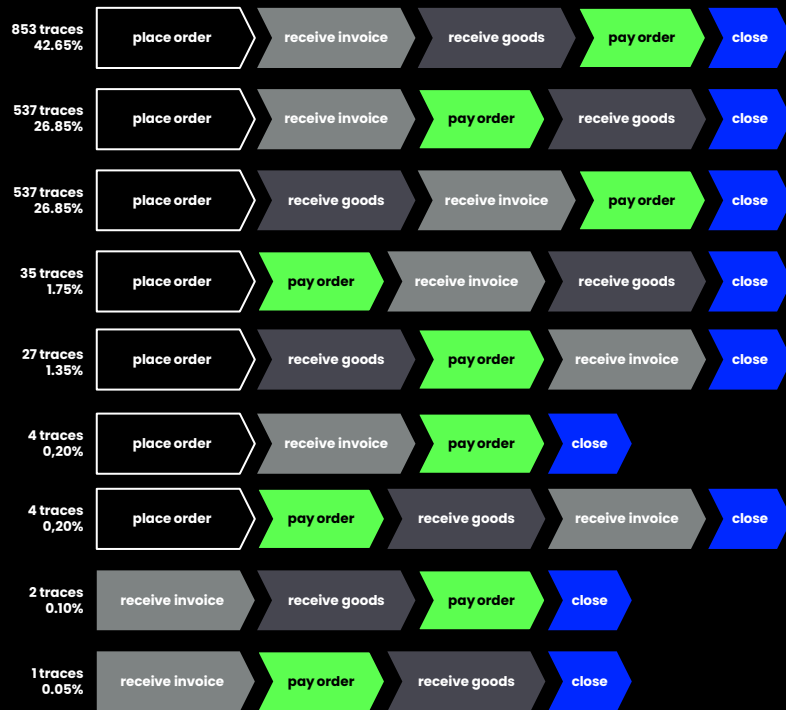

4x
missing re-
ceived goods

3x
missing
place order

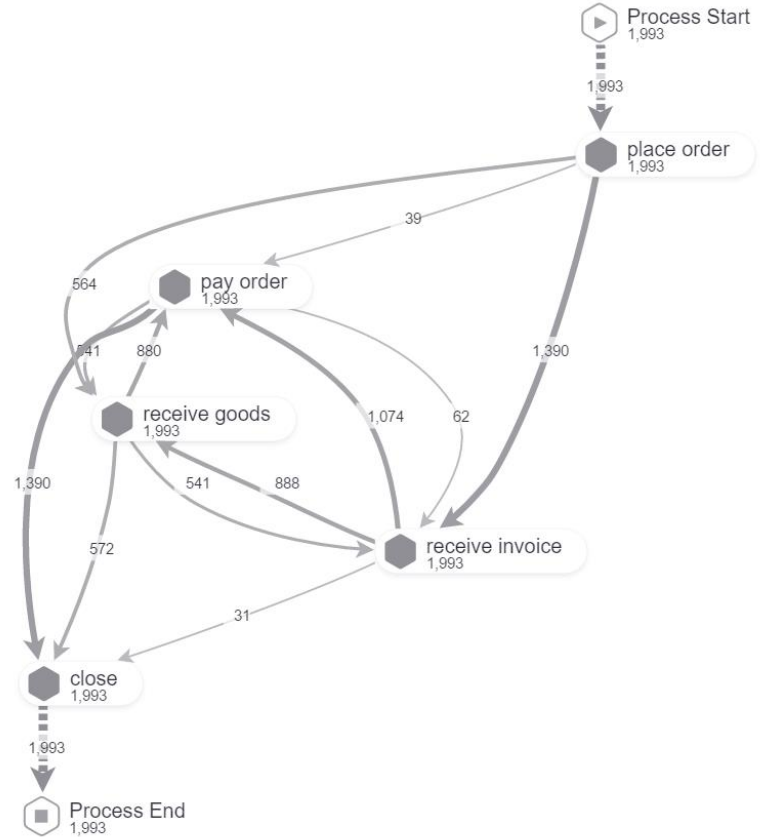

Not so easy to see the deviations in a DFG

DFG of conforming cases

C

DFG of deviating cases

4 traces
0,20%

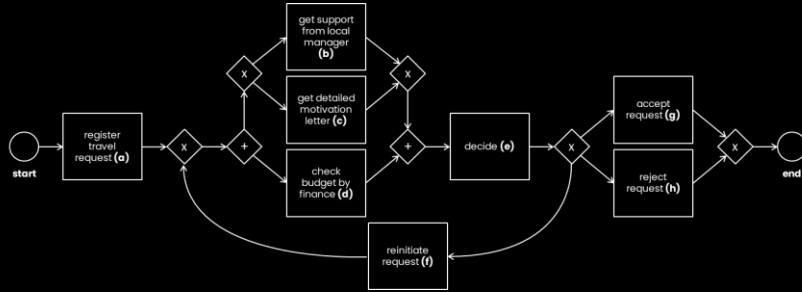

2 traces
0,10%

1 traces
0,05%

Conformance checking: Summary

conforming

a b d e g

deviating

a b c e h

Relevance

- To answer compliance questions
- Understand where model and reality disagree
- Auditing, fraud detection, process improvement

We have seen three techniques

- Alignments
- Footprint comparison
- Token-based replay

Token based replay in Celonis

- Celonis is using a variant of token-based replay
- The BPMN model is translated to a Petri net
- Diagnostics are presented as sentences

Conforming cases

60%

Cases conforming

Conforming cases

1.97k vs. 1.34k

Cases conforming

Throughput time

32.4 vs. 7.6 Days

Violations increased throughput time by 24.8 Days

1%
of cases

Delivery Block changed is an undesired activity

[Add to whitelist](#) [View cases in...](#)

Effect on throughput time Effect on steps per case
64 Days longer + 11.5 Steps per case

1%
of cases

Create Sales Order Item is followed by *Create Invoice*

[Add to whitelist](#) [View cases in...](#)

Effect on throughput time Effect on steps per case
4 Days longer - 1.0 Steps per case

1%
of cases

Goods Issue is followed by *Create Delivery*

[Add to whitelist](#) [View cases in...](#)

Effect on throughput time Effect on steps per case
49 Days longer + 8.4 Steps per case

Next lecture: Getting the data
